

Computer Methods in Engineering

Exercise 6

In this exercise we will work on using the conjugate gradient method to solve an elliptic equation. More specifically, we will solve the Laplace equation we encountered in Exercise 3 . Recall that Exercise 3 was considering flow in porous media as governed by the Darcy equation:

$$\vec{q} = -\frac{k}{\mu} \nabla p \quad ,$$

where q is the volumetric flow rate, k is the permeability (a measure for how well the porous medium allows for transport of fluids), μ is the viscosity of the fluid, and p is the fluid pressure. At steady state this gives the Laplace equation $\nabla^2 p = 0$. We considered a two-dimensional model, thus

$$\nabla = \left(\frac{\partial}{\partial x'}, \frac{\partial}{\partial y} \right)$$

Assume a sand-body connecting two fluid reservoirs at different pressure. The left reservoir has a pressure $p_l = 1 \times 10^5$ Pa, while the right reservoir has a pressure $p_r = 2 \times 10^5$ Pa. The sand-body has a shape between the two reservoirs as outlined in Fig. 1, where the grid cell size is $100 \text{ m} \times 100 \text{ m}$. Further, assume a viscosity of 1×10^{-3} Pa s, a permeability of $1 \times 10^{-10} \text{ m}^2$, and assume a sand body thickness of 10 m.

We saw in Exercise 3 that this gave the matrix representation for the pressure field as $A\vec{P} = \vec{b}$, where the A matrix was given as

[illegible]

$$\vec{b} = \begin{bmatrix} -100000 \\ 0 \\ 0 \\ 0 \\ -100000 \\ 0 \\ 0 \\ 0 \\ 0 \\ 0 \\ 0 \\ 0 \\ 0 \\ 0 \\ 0 \\ 0 \\ 0 \\ -200000 \\ 0 \\ 0 \\ 0 \\ 0 \\ -200000 \end{bmatrix}$$
